+ The company now also offers an oven 'to borrow'. It comes in a container and offers the possibility of the company baking its own products on different trays with thermo-oil under real conditions.

When it comes to testing, prior to the purchase of an oven, these tests with the bakery's own products are frequently carried out in the technical centers at the oven manufacturers. The reason for this is simple; it is much cheaper to transport raw materials than ovens, in particular large tunnel ovens. However, several

disadvantages cannot, as yet, be eliminated – the master baker as well as process and climate in the technical centers can be different to those in one's own production facility.

The test oven, a Thermo-Roll by Heuff is now filling this gap. Trialing of how to bake in a thermo-oil oven can now be done within the company. The oven comes completely mounted in a container and can handle tray sizes of 60 x 80 cm. It does not only accept trays but also baking pans, hinge-plate belts, different wire belts and even stone plate belts or belts

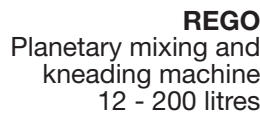

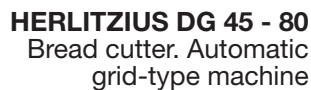

composed of different materials. For stone plate belts, the customer can choose from several materials: polished granite, four different types of cast stone or even tuff. It is also possible to test the oven with a baking chamber entirely lined with stone. Generally, a master baker from Heuft is available for guidance during the baking tests. The borrowed oven in the container is delivered with a sturdy frame; it can be removed from the container with an ele-

vating truck. The next step is to connect power, water and the steaming plant and then the baking test can start. According to Thomas Heuft, General Manager, the reason for this new service is that many clients who are not using thermo-oil ovens now have the opportunity to test the technology with their own products. The results achieved with the test oven can be transferred 1:1 to rack, deck or tunnel ovens, reports Heuft. +++

Because it's only the best that counts!

With us bakers all over the world work easier, faster and better
